

S10 - Dynamic Ride Fare

PROGRAM

```
class Ride:
    def __init__(self, distance, premium, peak):
        self.distance = distance
        self.premium = premium
        self.peak = peak

    def fare(self):
        fare = 50 + (self.distance * 15)

        if self.premium == "YES":
            fare *= 1.4

        if self.peak == "YES":
            fare *= 1.2

        fare = max(fare, 100)

        print("Ride Fare =", round(fare, 2))

r = Ride(10, "YES", "YES")
r.fare()
```

OUTPUT

Ride Fare = 336.0
